DETAILED ACTION

Response to Amendment

The response and amendment to the claims, filed by applicant on 7/21/2008, have been entered.

Claim Rejections - 35 USC § 103

The rejection of claims 1-11 under 35 U.S.C. 103(a) as being unpatentable over Luken et al. (US 6,534,210), in view of Van Dine (US 6,514,635) has been overcome by applicant's amendment to the claims.

Allowable Subject Matter

Claims 1-11 are allowed.

The following is an examiner's statement of reasons for allowance:

The instant claims are to a method of fuel cell start-up for a fuel cell system having a hydrogen source connected to an anode inlet of a fuel cell stack and an oxygen source connected to a cathode inlet of the fuel cell stack, the cathode inlet being connected to a compressor, the method comprising the steps of:

purging hydrogen from the fuel cell stack with air prior to startup; starting the fuel cell system by re-introducing said hydrogen to the anode inlet of the fuel cell stack, said hydrogen reacting with said air to generate an initial amount of electrical power;

determining said initial amount of electrical power generated by the fuel cell stack with an electronic controller;

applying an electrical load to the fuel cell stack via the compressor for supplying oxygen to the cathode inlet based on said initial amount of electrical power of the fuel cell stack; and

gradually increasing said electrical load on the fuel cell stack over time while using increased electrical power generated to drive the compressor to supply additional oxygen to the cathode inlet.

The prior art does not teach the method, as claimed. The most pertinent prior art has been presented. For example, Luken et al. (US 6,534,210) teaches a method comprising the steps of introducing hydrogen to the anode inlet of the fuel cell stack; applying an electrical load to the fuel cell stack via the compressor for supplying additional oxygen to the cathode inlet; gradually increasing the electrical load to the fuel stack over time while using the increased electrical load to drive the compressor to supply additional oxygen to the cathode inlet. The fuel cell includes a hydrogen source connected to an anode inlet of a fuel cell stack and an oxygen source connected to a cathode inlet of the fuel cell stack, with the cathode inlet being connected to a compressor. A controller opens a valve to flow hydrogen to the anode of the fuel cell. Ambient air is used as the oxidant. A stored amount of oxygen is released from the compressor following the introduction of hydrogen. Further, stored oxygen in the ambient fuel cell is used at the cathode. The reference teaches gradually increasing the electrical load to the fuel stack over time while using the increased electrical load to drive the compressor. The step of gradually increasing the electrical load to the fuel cell stack may be performed on an open loop basis

according to a timed schedule. Luken does not teach the step of purging hydrogen from the fuel cell stack with air prior to startup or subsequently reintroducing the hydrogen to the anode inlet.

In addition, Van Dine teaches a method of shutting down a fuel cell. A final air purge assures that even the smallest amounts of hydrogen are flushed from the cell, and that the anode and cathode flow field gasses remaining in the cell after shut-down are essentially identical. Van Dine does not teach the step of purging hydrogen from the fuel cell stack with air prior to startup or subsequently reintroducing the hydrogen to the anode inlet.

Because the prior art does not teach or render obvious the claimed invention, the claims are allowed. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
